#### Abstract:

Vertebrate systems operate limbs with many more muscles than degrees of freedom, which creates redundancies for isometric force production. Optimization is usually proposed as the means by which the nervous system solves such underdetermined problem. However, the learning and execution problem can also be approached from the geometric perspective of heuristic or systematic exploration of high-dimensional spaces, and exploitation of feasible regions found and remembered. We apply such approach to assess the learnability of the input-tension to output fingertip force mapping for the seven tendons of a human cadaver index finger. We applied five thousand different 7-dimensional tension vectors, while simultaneously recording the resulting isometric fingertip force outputs. We analyzed the relationship between the input and output in both the forward and inverse directions using a linear regression model, an Artificial Neural Network, and a data-driven Nearest-Neighbor lookup table. We find that forward models perform more accurately than inverse models and that the Nearest-Neighbor approach has a notable fit error at the edges of the input space. These results open a new front for a thorough understanding of how the actual physics of an anatomical system (i.e., the plant the brain must contend with) fundamentally affects learning, memory, and performance of motor function in health, disease, and in an evolutionary context. **Figure 1:** A parallel coordinate plot of 5000 muscle tension patterns implemented on a human cadaver finger highlights how sparsely the edges of the input space are explored with uniform sampling.

**Presentation Preference (Complete):** Poster Only

**Linking Group (Complete):** None selected

**Theme and Topic (Complete):** E.09.c. Motor unit recordings, kinematics, and EMG ; D.08.b.

Sensorimotor transformation: Behavior and whole animal

**Nanosymposium Information (Complete):**

**Keyword (Complete):** MOTOR CONTROL ; LEARNING ; MUSCLE

**Support (Complete):**

**Support:** Yes

**Grant/Other Support:** : NIH R01 AR-050520 and R01 AR-052345 to FJV-C

**Grant/Other Support:** : NSF GRFP to BAC

**Grant/Other Support:** : DOD MR150091 to FJV-C

**Special Requests (Complete):**

**Would you be interested in being considered for a dynamic poster?:** Yes, I am interested in presenting a Dynamic Poster

**If yes, please explain why your research would be best presented as a dynamic poster as opposed to a traditional poster or nanosymposium presentation.** : I have a seven dimensional visualization of data that is interactive, and an animation that shows the datastreams. These concepts are challenging to communicate without animation, color, and interactivity.

**Is the submitting author of this abstract also a senior author?:** No

**Is the first (presenting) author of this abstract a high school or undergraduate student?:** None

**Religious Conflict?:** No Religious Conflict

**Additional Conflict?:** No

**Do you think the research described in your abstract tells a story that is ready to share and would be of interest to the media? Press activities for the annual meeting will begin in November 2018.:** Yes

**If yes, would you or a senior author on your abstract be willing to speak in a press conference about your research?:** Yes

**Status:** Finalized
